-I-FUNCTION: MAY BE INVOLVED IN CELL MIGRATION, CARTILAGE DEVELOPMENT AND IN LINKING SIGNAL TRANSDUCTION PATHWAYS TO THE CYTOSKELETON. BINDS TO ACTINN AND PHOSPHORYLATED PROTEINS IN SRC-TRANSFORMED CELLS. MAY BIND ACTIN WITH CAPPING AND BUNDLING PROPERTIES.

-I-SUBCELLULAR LOCATION: LOCALIZES TO ADHERENS JUNCTIONS.

-I-TISSUE SPECIFICITY: HEART, GIZZARD, LUNG AND SKELETAL MUSCLE.

-I-PIM: TYROSINE-PHOSPHORYLATED.

-I-SIMILARITY: CONTAINS 1 SH2 DOMAIN.

-:- FUNCTION: TRANSPORT OF PHOSPHORILATED LYSOSOMAL ENZYMES FROM THE GOLGI COMPLEX AND THE CELL STRFACE TO LYSOSOME. LYSOSOMAL ENZYMES BEARING PHOSPHOMANNOSYL RESIDUES BIND SPECIFICALLY TO MANNOSE-6-PHOSPHORE RECEPTORS IN THE GOLGI PAPPARATOR AND THE RESULTING RECEPTOR-LIGAND COMPLEX IS TRANSPORTED TO AN ACIDIC PRELYOSOMAL COMPARTMENT WHERE THE LOW PH MEDIATES THE DISSOCIATION OF THE COMPLEX. THIS RECEPTOR ALSO BINDS INSULIN GNOWTH FACTOR II.

-:- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN. LYSOSOMAL.

-:- DOMAIN: CONTAINS 15 REPRATING UNITS OF APPROXIMATIVELY 147 AA. THE MOST HIGHLY CONSERVED REGION WITHIN THE REPEAT CONSISTS OF A STRETCH OF 13 AA THAT CONTAINS CYSTEINES AT BOTH ENDS.
                        'Cloning of the bovine 215-kDa cation-independent mannose 6-phosphate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               POTENTIAL. . Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 31.486; Variance 47.986; scale 0.656

VIROLOGY 194:789-799(1993).

-! FUNCTION: E2 REGULATES VIRAL TRANSCRIPTION AND DNA REPLICATION.

-! FUNCTION: E2 REGULATES VIRAL TRANSCRIPTION OF E2RE'S POSITION MITH REGARDS TO PRESSIVE ESCHOOL IT CAN EITHER ACTIVATE OR REPRESS TRANSCRIPTION DEPENDING OF E2RE'S POSITION WITH REGARDS TO PROWITER ELEMENTS. REPRESSION OCCURS BY STERICALLY HINDERING THE ASSENBLY OF THE TRANSCRIPTION INITIATION COMPLEX. THE E1-E2 COMPLEX BINDS TO THE ORIGIN OF DNA HUMAN PAPILLOMAVIRUS TYPE 63. VIRUSES; DSDNA VIRUSES, NO RNA STAGE; PAPOVAVIRIDAE; PAPILLOMAVIRUS. SUBCELLULAR LOCATION: NUCLEAR. SUBUNIT: BINDS DNA AS A DIMER. 01-0CT-1994 (REL. 30, CREATED) 01-0CT-1994 (REL. 30, LAST SEQUENCE UPDATE) 15-UUL-1998 (REL. 36, LAST ANNOTATION UPDATE) REGULATORY PROTEIN E2. A 398 PRT; STANDARD; SEQUENCE FROM N.A. MEDLINE, 93276568. REPLICATION. RESULT 1 ID VE2\_HPV63 AC Q07850; NAME OF THE PROPERTY OF THE PR

"Primer-directed sequencing of human papillomavirus types.";

CURR. TOP. MICROBIOL. IMMUNOL. 186:13-31(1994).

-!- FUNCTION: E2 REGULATES VIABL TRANSCRIPTION AND DNA REPLICATION.

IT BINDS TO THE E2RE RESPONSE ELEMENT (5'-ACCNNNNNGGT-3') PRESEN

IN MULTIPLE COPIES IN THE REGULATORY REGION. IT CAN EITHER

ACTIVATE OR REPRESS TRANSCRIPTION DEPENDING OF E2RE'S POSITION

WITH REGARDS TO PROXIMAL PROMOTER ELEMENTS. REPRESSION OCCURS

BY STERICALLY HINDERING THE ASSEMBLY OF THE TRANSCRIPTION

INITIATION COMPLEX. THE E1-E2 COMPLEX BINDS TO THE ORIGIN OF DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

Mean 22.064; Variance 88.246; scale 0.250

Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Claim 5: Fig 4: 35pp: English.

Cused for treating obesity, diabetes, anorexia nervosa, bulimia, cachexia, chronic renal failure, renal disease, congestive heart failure, impaired classes tolerance and sexual dysfunction. The agonist is useful for treating and cachexia. The HFGAN72 receptor infections, particularly infections cachexia. The HFGAN72 receptor cancers, anorexia nervosa, bulimia, cachexia, obesity, diabetes, asthma, cancers, anorexia nervosa, bulimia, cachexia, obesity, diabetes, asthma, cancers, anorexia nervosa, bulimia, cachexia, obesity, diabetes, asthma, cancers, myocardial infarction, ulcers, asthma, allergies, benign pectoris, myocardial infarction, ulcers, asthma, allergies, benign constatic hypertrophy, chronic renal failure, renal disease, impaired constant caches and neurological discases as the constant constant caches and neurological discase.
                                                                                                                                                                                                                                                                                                                                                                         Rat HFGAN72 receptor protein.
HFGAN72 receptor; eating disorders; renal disease; heart failure; sexual dysfunction; HIV; cancer; Parkinson's disease; urinary retention; osteoporosis; angina pectoris; myocardial infarction; psychotic disorder;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          disorders including anxiety, schizophrenia, manic depression, delirium, dementia, severe mental retardation and dyskinesias such as Huntington' disease or Gilles dela Tourett's syndrome.
antagonists, in therapy, to detect Ab and to isolate cognate receptors. Oligonucleotides based on H35 cDNA can be used to detect the hypocretin gene or its RNA transcript, and as antisense agents for inhibiting gene expression. H35 cDNA can also be used for recombinant protein production. The Ab can be used to detect or quantify hypocretin proteins and as a therapeutic inhibitor.
                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                      Retinoid X receptor (RXR) interacting protein (RIP) - useful to modulate or mediate RXR function, anti-RIP antibodies can be used to determine RIP subcellular distribution patterns

Claim 2, Page 48-50, 90pp; English.

Mouse retinoid X receptor (RXR) interacting protein RIP110 (R99737) is a candidate transcriptional co-activator. It was identified using an in vivo interaction trap system for the isolation of proteins that physically interact with RXRs, esp. with the ligand binding domain of human RXR alpha. Recombinant RIP110 can be obtd. using a cDNA clone (T31930) obtd. from a mouse liver library. RIPS (see also R99735-36 and R99738-39) can be used to modulate or mediate RXR function, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Disclosure; Page 77-84; 110pp; English.
Saccharomyces cerevisiae DKD5D, which is sensitive to aureobasidin, was mutagenized with EMS and genomic libraries of 2 resistant strains were prepared. Resistant gene scaurlR (Q75954) was isolated from 1 library, and resistant gene scaurlR (Q75956) from the other. A DNA fragment of scaurl was used as a probe to isolate a sensitive gene, scaurlS (Q75955), from the sensitive strain. A TB52A mutation leading to a F158Y conversion gave rise to the resistance of scaurlR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The sequences given in W21731-32 represent fusion proteins which contain NuMA (nuclear mitotic apparatus). The fusion proteins were used in the identification of NuMA interecting proteins (NIP's) (see also W21729-30). Compounds which interfere with the interaction of NuMA with a known NIP are used to modulate cell division and/or proliferation. Ab, raised conventionally using NIP-1 or -2 as immunogen, are used to detect NIP (or their complexes) and to block their activity for detect NIP (or their complexes) and to block their activity for which may be markers for aberrant (including malignant) cell growth (which can also be detected by nucleic acid sequencing). Also where malignancy is related to defects in NuMA or NIP, it can be treated by

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  iymphotoxin, useful as antinflamatory agent, tumour growth inhibitor. T-cell inhibitor or activator. Claim 1: Page 60; 75pp; English.
A protein, designated p33, is found on the surface of several types of lymphocyte cells, including OKT3-stimulated primary T-cells, antigen-specific IL-2 dependent CTL clones, and a PMA-stimulated human T-cell hybridoma, IL-23.D7. It forms a novel complex with lymphotoxin (LT). The N-terminal of the p33 protein contains the sequence represented in R20234 or R20235. The sequence at the 6th cycle appeared to be a mixt. of both G and L indicating possible polymorphism. The p33 protein may have one of these sequences or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

Claim 2; Fig 2; 35pp; English.

The HFGAN72 receptor protein contains two ligands whose antagonists can be used for treating obesity, diabetes, anorexia nervosa, bulnina, cachexia, chronic renal failure, renal disease, congestive heart failure, impaired glucose tolerance and sexual dysfunction. The agonist is useful for treating anorexia nervosa, bulinia and cachexia. The HFGAN72 receptor ligand is useful for treating e.g. bacterial, fungal, protozoan and viral infections, particularly infections caused by HIV-1 or HIV-2, pain, cancers, anorexia nervosa, bulimia, cachexia, obesity, diabetes, asthm, parkinson's disease, both acute and congestive heart failure, hypotension, hypertension, urinary retention, osteoporosis, angina pectoris, myocardial infarction, ulcers, asthma, allergies, benign prostatic hypertrophy, chronic renal failure, renal disease, impaired glucose tolerance, sexual dysfunction and psychotic and neurological disorders including anxiety, schizophrenia, manic depression, delinium, dementia, severe mental retardation and dyskinesias such as Huntington's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Glial cell line-derived neurotrophic factor receptor gamma 1.

I all the HFGAN72 receptor protein contains two ligans whose antagonists can be used for treating obesity, diabetes, anorexia nervosa, bulimia, cachexia, chronic renal failure, renal disease, congestive heart failure, impaired glucose tolerance and sexual dysfunction. The agonist is useful for treating anorexia nervosa, bulimia and cachexia. The HFGAN72 receptor ligand is useful for treating e.g. bacterial, fungal, protozoan and viral cancers, anorexia nervosa, bulimia, cachexia, obesity, diabetes, pain, cancers, anorexia nervosa, bulimia, cachexia, obesity, diabetes, asthma, protension, hypertension, urinary retention, osteoporosis, angina protozis, myocardial infarction, ulcers, asthma, allergies, benign prostatic hypertrophy, chronic renal failure, renal disease, impaired disconse tolerance, sexual dysfunction and psychotic and neurological.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human HFGAN72 receptor protein.

Claim 2: Page 85-86; 113pp; English.

This annino acid sequence comprises human Ret ligand (RetL) RetL3,

This annino acid sequence comprises human RetL1, human RetL2 and

Geduced from CDNA clones (see W37457-62) are also claimed. Human

RetL3 is 34.3% identical to human RetL1, human RetL2 and

mouse RetL3 is 34.3% identical to human RetL1, 34.9% identical to human

RetL2 and 76.8% identical to human RetL1, 34.9% identical to human

RetL2 and 76.8% identical to human RetL1, 34.9% identical to human

RetL3 and 76.8% identical to human RetL1, 34.9% identical to human

RetL3 and 76.8% identical to human RetL1, 34.9% identical to human

RetL3 and 76.8% identical to human RetL1, 34.9% identical to human

RetL3 and 76.8% identical to human RetL1, 34.9% identical to human

RetL3 and 76.8% identical to human RetL3, is set ligand is a key

component of the Ret signalling pathway that specifically

interacts with Ret receptor protein, triggering Ret dimerisation

vectors containing retL3 DNA and prokaryotic or eukaryotic host

cells transformed or transfected with these vectors are claimed, as

well as a method for production of RetL3, its soluble variants and

fusion proteins with a toxin, imageable compound or radionuclide.

RetL3, optionally when expressed from vectors in vivo, is used to

promote growth of new tissue and survival of damaged tissue,

particularly kidney or neural tissue. Typical applications are in

renal failure, nephritis, kidney transplants, toxic or hypoxic

injury, neurodegeneration, motor neuron disease, multiple sclerosis,

bacterial, viral or prion infections (e.g. meningitis, myelopathy

associated with HIV or Creutzfeldt-Jakob disease), cranial nerve or

spinal cord injury, developmental disorders such as Down's syndrome

system (Lyme disease, muscular dystrophy and myasthenia gravis).

Fusion proteins are used to deliver toxins etc. to Ret-expressing 3 This sequence represents a novel glial cell line-derived neurotrophic factor alpha-3 receptor (GDNF alpha-3). This protein can be used to treat e.g. neurodegenerative diseases (such as Parkinson's Disease, amyotrophic lateral sclerosis (ALS), spinal muscular atrophy (SMA), Huntington's Disease, Alzheimer's Disease, diabetic neuropathy), muscular diseases (including the muscular dystrophies) and nerve and sequence 400 AA; vectors, transformed cells and antibodies, used for promoting cell growth and improving survival of injured cells, especially renal or Gaps New nucleic acid encoding ret receptor ligands and related proteins Human Ret ligand RetL3.

                                                                                                                                                                                                                                                           Gaps
single residue. Embodied within repeats 5, 6, 7 and 8 is the consensus sequence for Asp and Asn hydroxylation. The 7th repeat contains the consensus O-glycosylation sequence. CXCXFC.
Immediately following each repeat is a pentapeptide with the consensus sequence XD(I/V)(D/N)E. Fibulin binds to the cytoplasmic domain of the betal subunit of integrin adhesion receptors in a cation-dependent, EDTA-reversible manner. It can be used to manipulate adhesion of cells to fibronectin, collagen, with the protein have important diagnostic and therapeutic uses. See also R11149 and R11150.

Purified fibulin, DNA encoding it and antibodies reactive with it useful as diagnostic and therapeutic component.

Scalaim 10; Fig 4; 56pp; English.

Claim 10; Fig 4; 56pp; English.

The fibulin A, B and C forms are identical from their N-terminals to a divergence point at posn. 566 ( terminal codon in fibulin A)

and 683 residues resp.

All three forms are rich in cysteine (11 %) and 683 residues resp. All three forms are rich in cysteine (11 %)

and analysis wrt no. and spacing of the Cys residues revealed two types of repeat moftif (I and II). The type I motif, CC(X)12c-

C(X)9-10C(X)6CC is repeated twice, separated by an imperfect form of the repeat lacking two Cys residues. The same motif is found in complement components C3a, C4 and C5a; the inverse is found in complement components C3a. The same motif is found in complement components C3a. The same motif is found in complement components C3a. The same motif is found in complement components C3a.

The type II motif, related to repeats found in epidermal growth the city precursor is a 6-Cys pattern repeated nine times, although the ninth repeat in the A form is incomplete. Four of the repeats.

C(2, 3, 4 and 9) differ from the EGF-like motif in having a 4-6 residue insertion between cysteines 4 and 5 instead of the usual consensus sequence for Asp and Asn hydroxylation. The 7th repeat contains the consensus 0-gir/cosylation sequence, CXCXPC.

Immediately following each repeat is a pentapeptide with the consensus of the betal subunit of integrin adhesion receptors in a cation-dependent, EDTA-reversible manner. It can be used to manipulate adhesion of cells to fibronectin, collagen, faminin, and possibly also other proteins. Antibodies reactive with the protein have important diagnostic and therapeutic uses.

Sequence ASP HILM4, XII148 and XII150.

"Fibulin, a novel protein that interacts with the fibronectin receptor bette subunit cytoplasmic domain.";
-1. 58:623-629(1989).
-1. SUBCELLULAR LOCATION: EXTRACELLULAR MATRIX.
-1. ALTERNATIVE PRODUCTS: FOUR FORMS OF FIBULIN-1; A (SHOWN HERE), B (A P23143), C (AC P23144) AND D (AC P37888); DIFFERING ONLY IN THEIR C-TERMINAL REGIONS, ARE PRODUCED BY ALTERNATIVE SPLICING.
-1. SIMILARITY: CONTAINS 8 COMPLETE AND ONE INCOMPLETE EGF-LIKE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ALTERNATIVE SPLICING; GLYCOPROTEIN; EXTRACELLULAR MATRIX; PLASMA; EGF-LIKE DOMAIN; CALCIUM-BINDING.

LOS. TRANS. R. SOC. LOND., B, BIOL. SCI. 306:345-354(1984).

FUNCTION: C10 ASSOCIATES WITH THE PROBNZYMES C1R AND C1S TO YIELD

EUNCTION: C10 ASSOCIATES WITH THE PROBNZYMES C1R AND C1S TO YIELD

C1, THE FIRST COMPONENT OF THE SERUM COMPLEMENT SYSTEM. THE

COLLAGEN-LIKE REGIONS OF C1Q INTERACT WITH THE CA(2+)-DEPENDENT

C1R(2)C1S(2) PROBNZYME COMPLEX, AND EFFICIENT ACTIVATION OF C1

TAKES PLACE ON INTERACTION OF THE GLOBULAR HEADS OF C1Q WITH THE

FC REGIONS OF IGG ANTIBODY PRESENT IN IMMONE COMPLEXES.

SUBJUNIT: C1 IS A CALCIUM-DEPENDENT TRIMOLECULAR COMPLEX OF C1Q,

R AND S IN THE MOLAR RATION OF 1:2:2.

SUBJUNIT: C1Q SUBCOMPONENT IS COMPOSED OF NINE SUBUNITS, SIX OF
